Fitness Workout Classifier: Product Requirements Document

Version 1.0 | November 3, 2026 | Target: static web app on Netlify, no database

1. Overview

The app helps people find workout videos that fit them. Users pick an age group, a body size band and a body focus area (for example glutes or core), and the app returns a short, curated list of matching YouTube videos with the intensity and impact level shown on each. The goal is to replace endless searching with a classified, filterable library.

2. Goals and non-goals

Goals

- Classify workouts by age group, body size band, workout type, intensity and body focus area.
- Let a user reach a suitable video in three taps or fewer from the home screen.
- Run as a static site on Netlify with no database, no user accounts and no server to maintain.

Non-goals (v1)

- No accounts, logins, payments or social features.
- No medical advice, diagnosis, calorie targets or weight-loss programs.
- No hosting or re-uploading of video; videos are played through YouTube embeds only.

3. Users

User	Need
Beginner adult (18-39)	Safe, short, low-impact starting routines without gym equipment.
Adult 40-59	Joint-friendly strength and mobility; efficient 15-30 minute sessions.
Older adult (60+)	Balance, chair-based and gentle strength work with clear pacing.
Teen (13-17)	Age-appropriate fitness content, with guidance to involve a parent or coach.
Larger-bodied exerciser	Videos with modifications and low-impact options, presented without judgment.

4. Classification model

Every video carries one value or more from each dimension below. The app filters on these tags, so the tag set below is the core of the product.

Dimension	Values	Notes
Age group	Teen 13-17; Adult 18-39; Adult 40-59; Senior 60+	Self-selected. Teen results exclude max-intensity and weight-loss framing and show a guidance note.
Body size band	Self-chosen: Comfort (low impact); Standard; Strength-focus. Optional weight range in kg or lb used only to prefer low-impact picks (under 60 kg / 60-85 / 85-110 / 110+ kg)	Stored on the device only. Bands steer impact level; they are not health categories and no BMI is shown.
Workout type	Strength; Cardio / HIIT; Yoga; Pilates; Mobility and stretching; Walking; Dance	Multi-select filter.

Dimension	Values	Notes
Body focus	Glutes; Core (abs and tummy control); Legs; Arms; Back and posture; Full body	See the note on spot reduction below.
Intensity and impact	Gentle; Moderate; Intense. Low impact; High impact	Shown as a badge on every card.
Duration and equipment	Under 10; 10-20; 20-40; 40+ minutes. None; Dumbbells; Bands; Chair	Practical filters.

Spot reduction note. Exercise strengthens targeted muscles, but it does not burn fat from one body area. The app therefore labels the focus areas as muscle groups (for example Core) and uses plain wording such as "tummy control" only as a search alias, with a short note explaining this.

5. Functional requirements

ID	Requirement	Priority
F1	Onboarding screen: choose age group and size band in under 30 seconds; can be skipped; editable any time.	P0
F2	Results grid of videos filtered by the chosen tags, with thumbnail, title, duration, intensity and impact badges.	P0
F3	Body focus picker with a clear icon per area; selecting one filters results instantly.	P0
F4	Video page with the YouTube embed, tag list, modification tips and a safety note.	P0
F5	Combined filters: type, duration, equipment and intensity, with a clear-filters button.	P0
F6	Favorites list saved in the browser (localStorage). No account needed.	P1
F7	Search box that maps phrases like "tummy" or "booty" to the matching tags.	P1
F8	Build-a-session: pick three videos and see the total time.	P2
F9	Light and dark theme; works on phones first.	P1

6. Video sourcing and data (no database)

The source of truth is one JSON file kept in the project repository and deployed with the site. Each entry records a YouTube video id and its classification tags, assigned by a person reviewing the video:

```
{ "id": "VIDEO_ID", "ageGroups": ["adult-18-39","adult-40-59"],
  "sizeBands": ["comfort","standard"], "type": "strength",
  "focus": ["glutes"], "intensity": "moderate", "impact": "low",
  "minutes": 15, "equipment": ["none"], "reviewed": "2026-11-03" }
```

- **Finding candidates:** a small admin script run on the developer's machine uses the YouTube Data API (search.list plus videos.list for views and duration) to produce a candidate list. A person then tags and approves each video. Nothing is auto-classified in production.
- **Live data:** a single Netlify Function can refresh view counts and thumbnails for approved ids. The API key is stored as a Netlify environment variable and never reaches the browser. Responses are cached with HTTP cache headers.
- **Quota:** the default is 10,000 units per day. Sources conflict on the cost of one search (100 units on one Google page, 1 on another), so plan for 100. Curating offline keeps production usage near zero.
- **Playback:** videos play in the YouTube embed (youtube-nocookie.com) with attribution, following the API terms. The app does not download or re-host video.

7. Technical approach

- Static front end (HTML, CSS and JavaScript, or a light framework such as React with Vite) built and deployed from a Git repository to Netlify.
- One optional Netlify Function for live YouTube metadata; everything else is static files.
- User choices and favorites live in localStorage on the user's device. No personal data is sent to a server.
- Performance target: first load under 2 seconds on a mid-range phone; images lazy-loaded.
- Accessibility: keyboard navigation, readable contrast, labeled controls and alt text.

8. Safety, content and legal

- A visible notice on first use and on every video page: general fitness information, not medical advice; consult a doctor before starting, especially with an injury, a health condition, pregnancy or advanced age.
- Teen mode removes extreme-intensity videos and any weight-loss or body-shaming framing.
- Body-neutral language throughout: describe effort and impact, never judge size.
- Only videos a reviewer has watched are shown; a Report button links to a feedback email.
- The privacy notice states that preferences are stored only on the device. Follow the YouTube API Services terms of service and the embedded player rules.

9. Success metrics

Metric	Target (first 3 months)
Users who reach a video within 3 taps	80% or more
Share of sessions that play a video	50% or more
Returning users within 30 days	25% or more
Videos reviewed and tagged at launch	150 or more, at least 10 per body focus area

10. Milestones and open questions

Phase	Scope
1. Taxonomy and data	Finalize tags, build the admin script, tag the first 150 videos.
2. MVP build	F1 to F5 and F9, Netlify deploy, safety notices.
3. Polish and launch	F6 and F7, accessibility check, soft launch to a small group.

- Which language and region should the first video set target?
- Should the body size bands use kilograms, pounds or both?
- Who reviews and approves videos, and how often is the library refreshed?
- Will the app show ads or sponsor links later? This affects the YouTube terms review.
